

Translating Code Comments to Procedure Specifications

A. Blasi, A. Goffi, K. Kuznetsov, A. Gorla, M.D. Ernst, M. Pezzè, S. D. Castellanos

arianna.blasi@usi.ch

Wanted: missing specification

Specifications help test case generation:

- ✓ act as assertions
- ✓ filter invalid tests

But formal specifications are:

- ✗ seldom available
- ✗ hard to write

What we do have: *Javadoc comments*

```
/**  
 * @param vertex, must not be null  
 * @return list of vertex's neighbors, not empty  
 * @throws IllegalArgumentException if vertex is not found in the graph  
 */  
public List neighborsOf(V vertex){...}
```

Jdoctor generates procedure specifications from Javadoc comments

Pattern match

@param vertex, must not be null

vertex != null

Syntax match

@return list of vertex neighbors, not empty

!result.isEmpty()

Semantic match

@throws IllegalArgumentException if vertex is not found in the graph

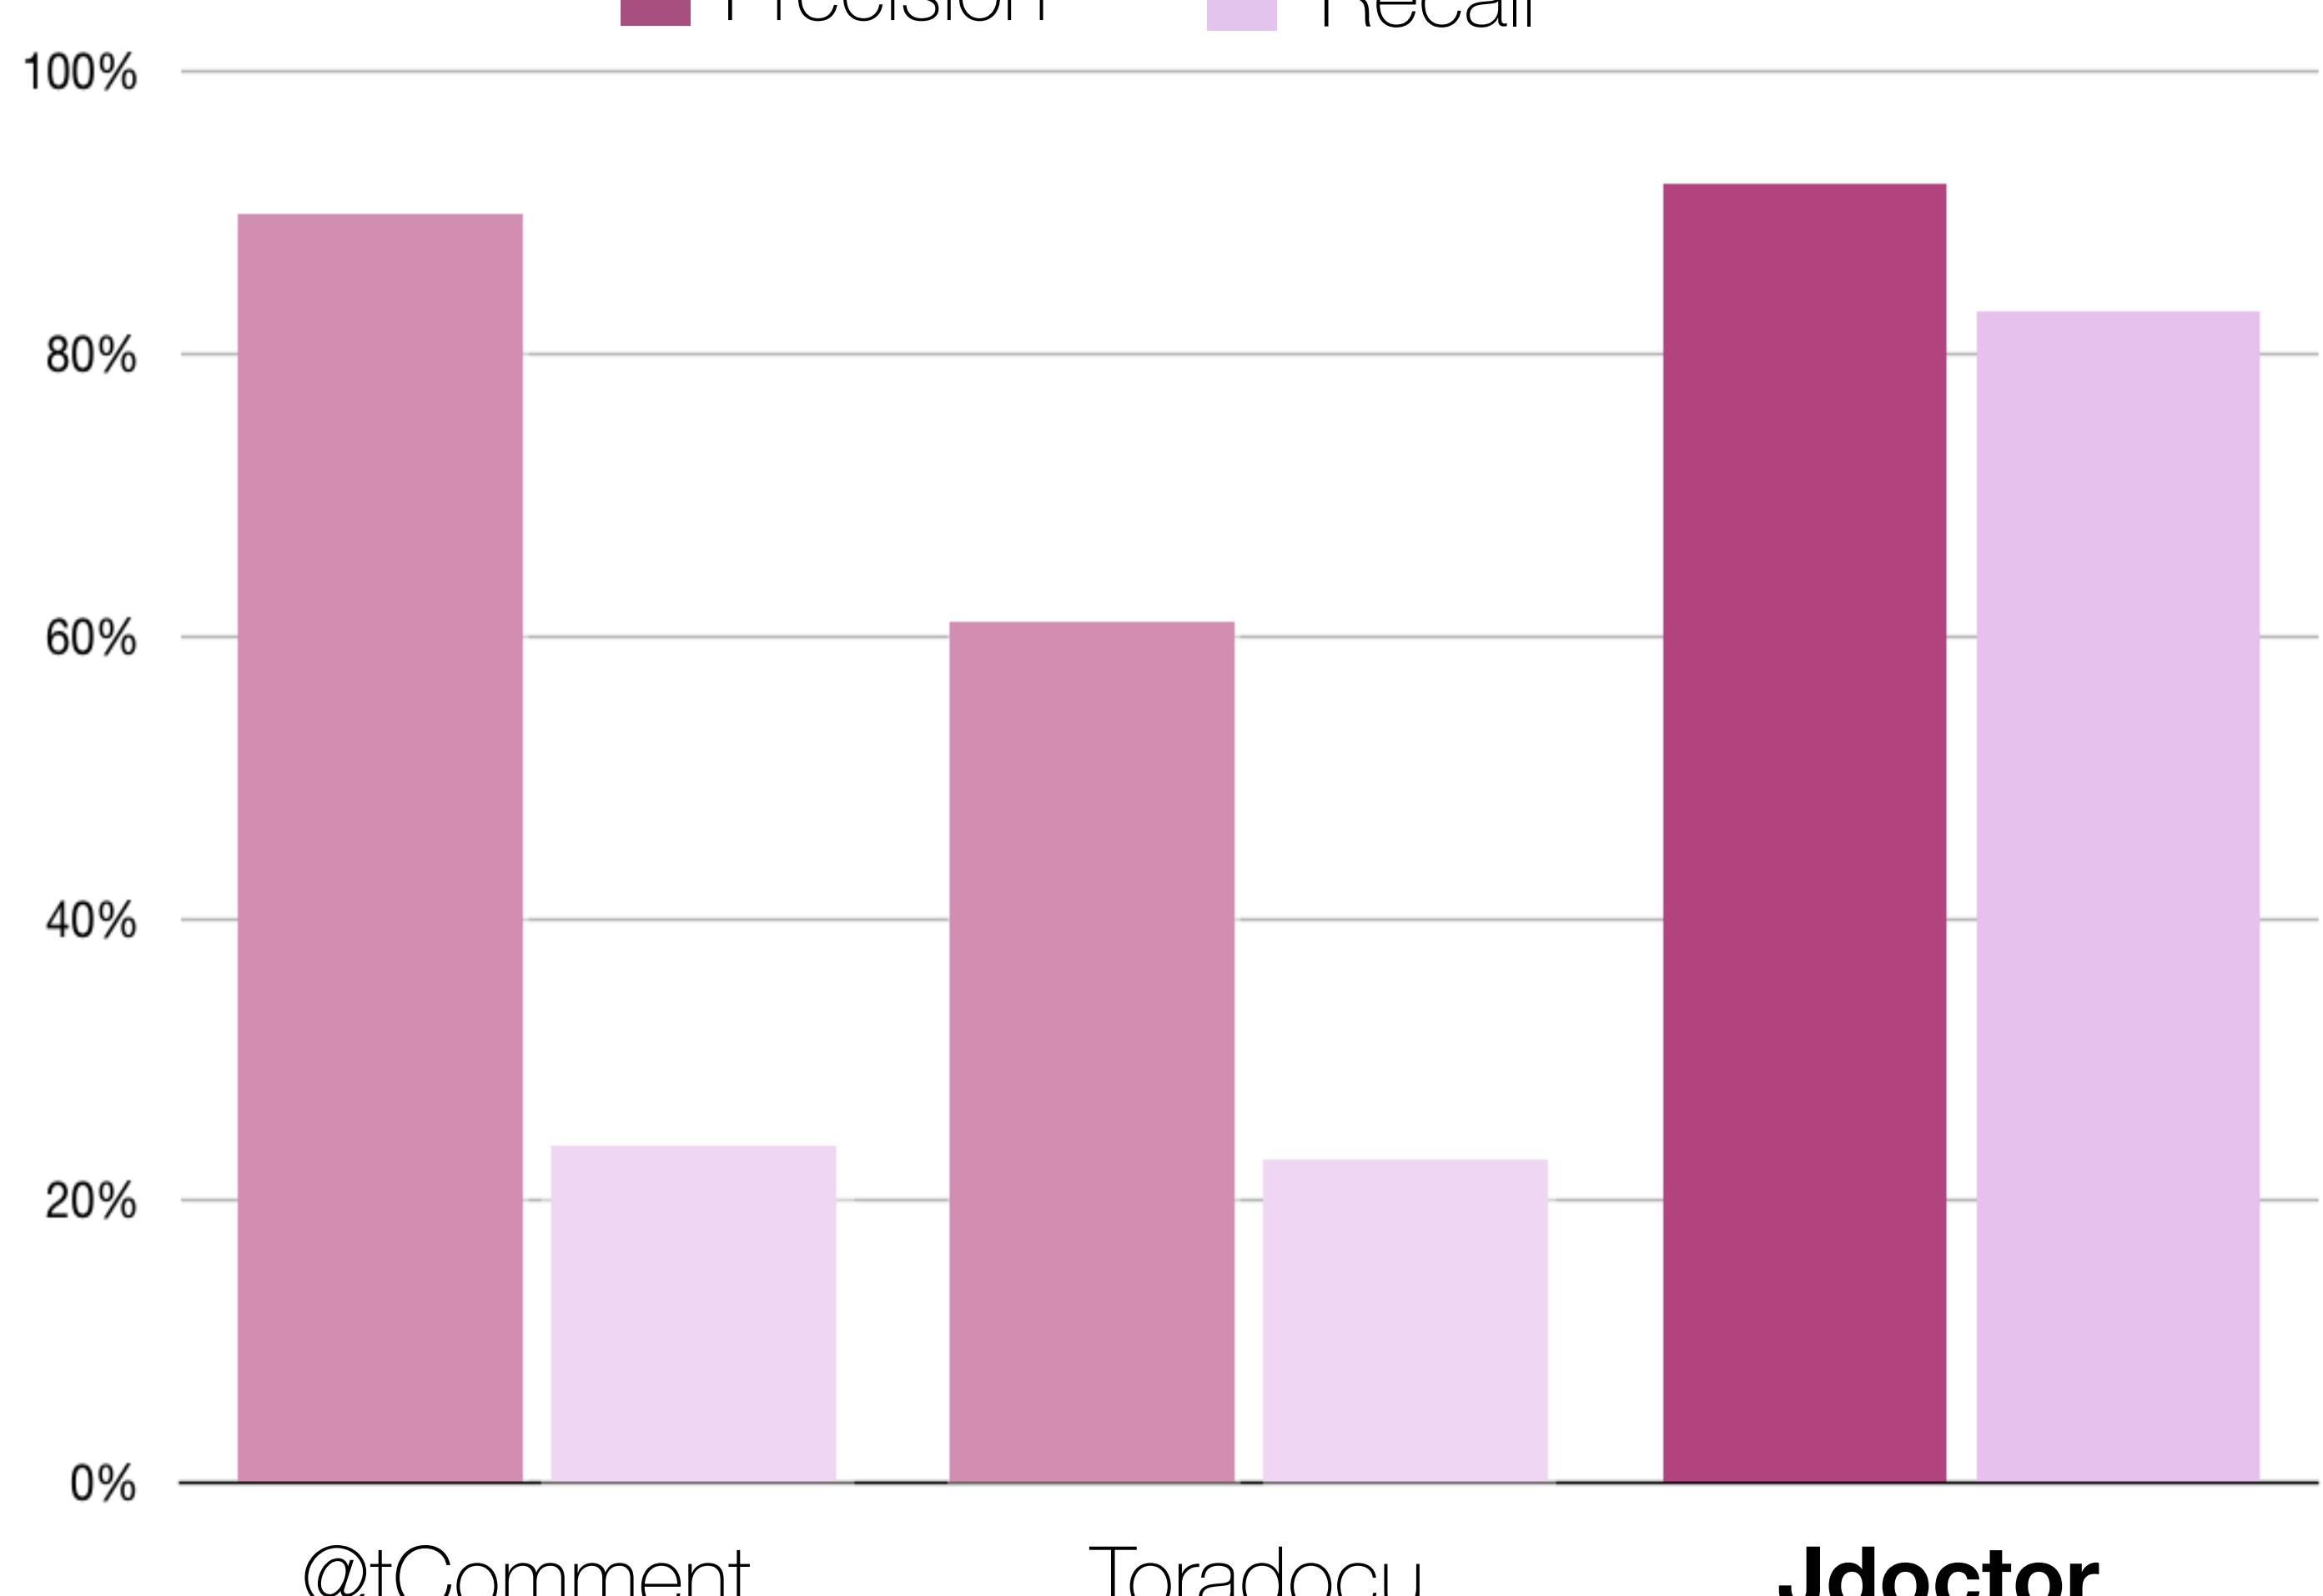

!graph.contains(vertex) -> IllegalArgumentException

Evaluation

6 projects
829 translations

Jdoctor outperforms the state of the art

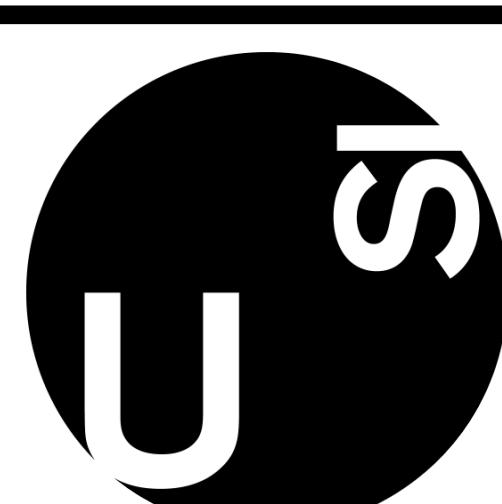

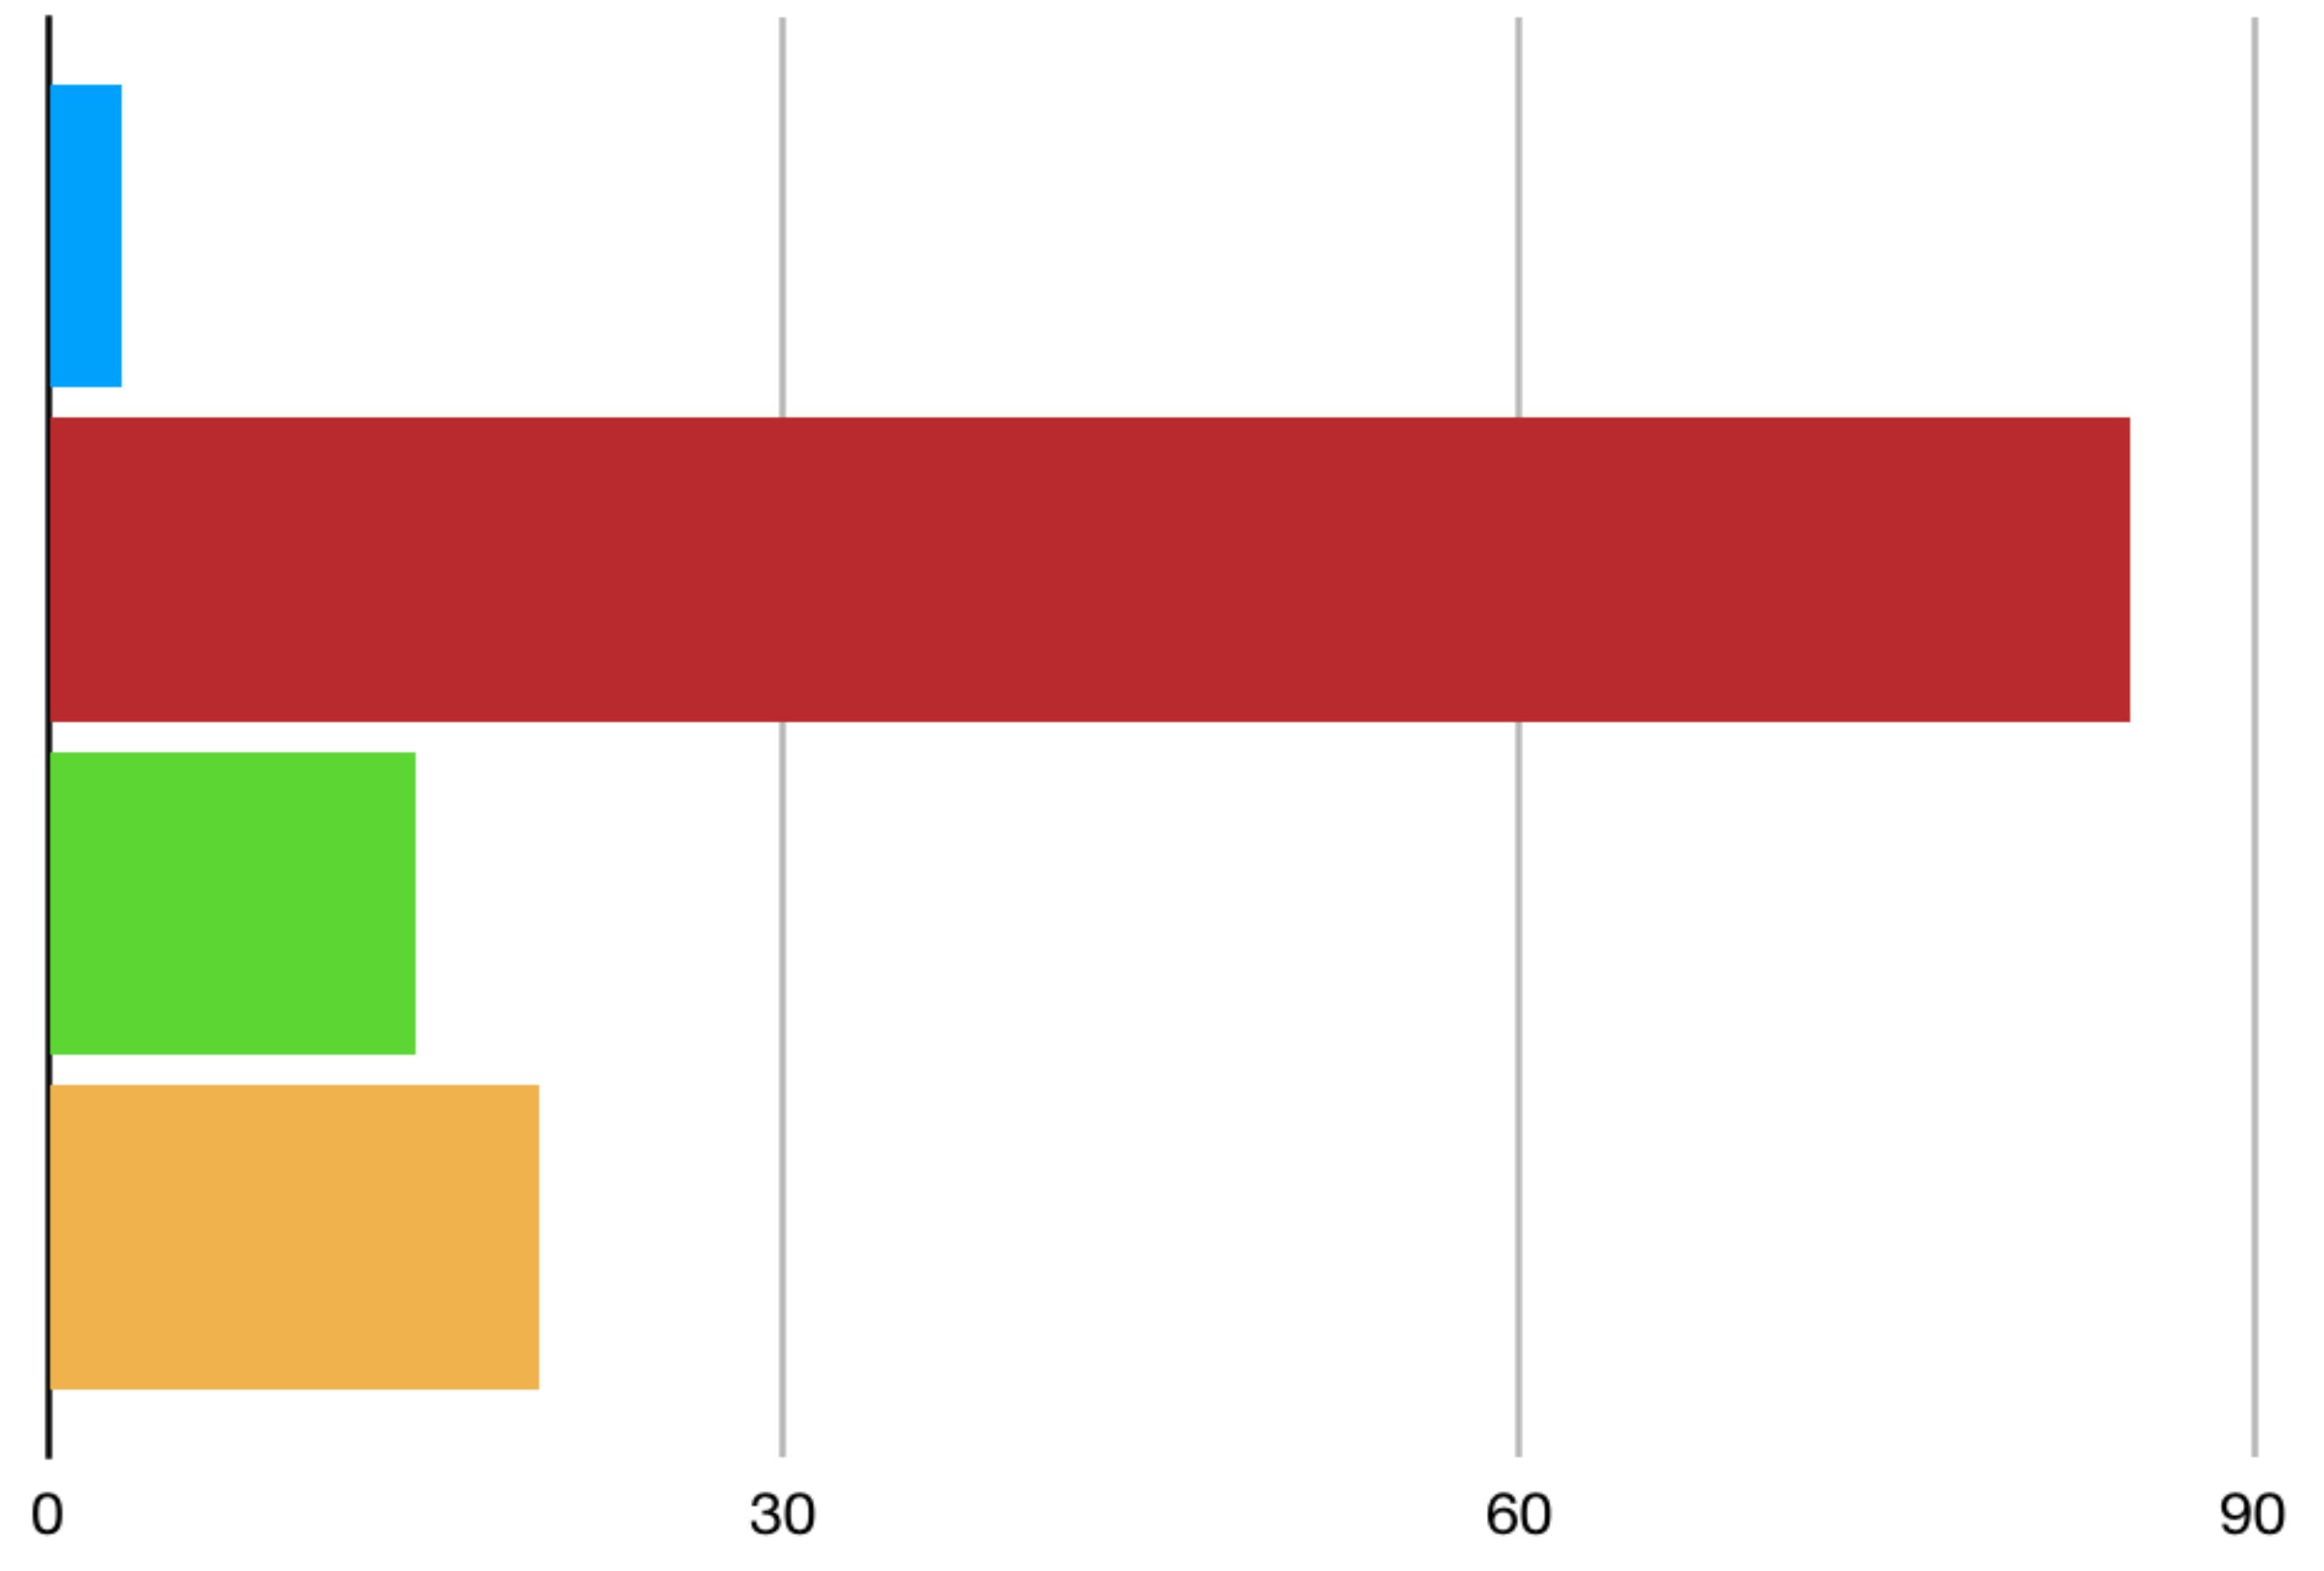

■ Precision ■ Recall

Application

Jdoctor improves Randoop's output by revealing more:

■ False alarms ■ Missed alarms ■ New tests ■ Invalid tests
